

PROJECT EXPLANATION TEMPLATE

Use this exact structure every time.

Project Name + One-Line Summary

Project Name: _____

Simple Summary:

This is a _____ system used for _____.

It helps _____ by doing _____.

Example:

This is a Fraud Monitoring Service used for validating customer data and sending alerts. It helps banks detect fraud quickly.

Problem the Project Solves (Business Problem)

Explain in simple English:

- What problem business was facing
- Why the system was needed
- What was happening before this system

Template:

The main problem was that _____.

Because of this, users/customers faced _____.

We built this project to solve _____.

Your Responsibilities (MOST IMPORTANT PART)

Keep it extremely clear:

- I developed _____
- I fixed _____
- I optimized _____
- I integrated _____
- I worked on performance/security/logging

- I participated in _____

Template:

My main responsibilities were:

1. Building and modifying backend APIs.
2. Writing business logic for _____.
3. Integrating the service with _____.
4. Handling production issues like _____.
5. Improving performance by _____.
6. Writing unit test cases and fixing vulnerabilities.

Tech Stack (Just list, no stories)

- Java ____
- Spring Boot
- Spring MVC
- Spring Data JPA / Hibernate
- Microservices
- MySQL / PostgreSQL
- Kafka (if used)
- Redis (if used)
- AWS/GCP (if used)
- Docker, Jenkins, Git
- Sonar, Checkmarx

Architecture (Very simple explanation)

Don't give complicated words.

Template:

The architecture is microservices-based.

Each service is independent and talks to other services using REST APIs / Kafka.

We used:

- Controller → Service → Repository pattern
- Database for storing data
- Kafka for async communication (if applicable)
- Redis for caching (if applicable)

High-Level Flow (Explain like a story)

Template:

1. The request comes from UI / another service.
2. Our service receives the request.
3. Validations happen (example: user details, input checks).
4. Business logic runs (ex: calculation, mapping, decision-making).
5. Data is fetched from the database / external API.
6. The response is built and sent back.

Challenges You Faced

Always mention 2–3 challenges:

- Performance issue
- Large data volume
- Slow queries
- Complex business logic
- Caching requirement
- API failures
- Production issues
- Migration tasks

Solutions You Implemented (Show maturity)

Template:

To solve the issue, I:

- Optimized the SQL query
- Used pagination
- Used caching (Redis)
- Used Kafka for asynchronous processing
- Improved code structure
- Added logs and monitoring
- Rewrote the logic to reduce time

Impact (Your contribution in numbers)

This impresses interviewers.

Examples:

- Improved API time from 4 seconds to 800 ms
- Reduced database load by 30%
- Reduced bugs by 40%
- Built reusable components
- Automated deployments

If no numbers, still say:

It improved performance and stability significantly.

STAR Summary (Final Closing Sentence)

Template:

Overall, in this project, I played an important role in designing, developing, and improving the service. I contributed to backend development, performance tuning, and handling real production issues.

FINAL PROJECT PITCH (One-Paragraph Version)

Use this when you want a short answer:

Template:

This project is a _____ system used to _____.

I worked mainly on backend development using Spring Boot, Microservices, and Java.

I built APIs, wrote business logic, integrated with external services, optimized performance, and fixed production issues.

The architecture is microservices-based with Controller → Service → Repository structure.

I handled challenges like _____ and solved them by _____.

Overall, my work improved the system's speed, stability, and reliability.
